

The mobile kitchen company

Company Policy

max maier® group of companies

We are a manufacturer and distributor of industrial kitchen appliances, refrigeration technology and supplied parts, made of stainless steel and SWISS | PLY material in particular. The maxmaier group of companies focuses on the cooking, storage, serving and transport of food for the commercial sector and for private homes as well as on supplier technology for the processing industry. Commercial properties are leased and managed through Rieber Services and eisfink is responsible for the training of our trainees in direct and indirect areas as well as for customer training on our products.

As part of our responsibility towards our customers, employees and other individuals with regard to our environment, we are committed to the sustainable use of resources and the sustainable protection of the environment. As a partner of the open, non-proprietary CHECK CLOUD platform, Rieber networks its products so that HACCP documentation can be recorded systemically and transparently. Further digital hygiene and service management features are available in addition to temperature recording. Rieber thus provides a tool for the safe organisation of food and contributes to the respectful use of resources at the same time. The aim is to create resource-saving, transparent and traceable processes by ensuring optimised food organisation, thereby also allowing for more resource-saving and cost-effective production. Waste is avoided in conjunction with our GN360 multi-cycle system: "Protecting resources is your future and our passion".

We use an integrated management system to continuously improve the quality of our products, our environmental awareness and energy management, as well as health protection and data security. This involves in particular ensuring compliance with legal and regulatory provisions, guidelines and standards as well as binding environmental protection, occupational safety, health protection and data security commitments – every single person in the group is committed to this.

Qualified, motivated and committed employees are our key success factor and help to develop safe, user-friendly and energy-efficient products, whereby emphasis is placed on maximum recyclability. New technologies are therefore proactively assessed in relation to the resource-friendly use of raw materials, energy, water and possible hazards to humans, animals and the environment.

We motivate our suppliers and authorised partners to comply with current environmental and safety standards through targeted specifications and information.

We follow the required safety standards when handling dangerous substances and try to replace these compounds with suitable alternatives whenever possible.

We focus on sustainability and regularly optimise not only our energy and water consumption, but especially the handling of our raw materials. The avoidance of (plastic) waste is a top priority for us.
